What is Identity?

Framework leveraging cookie authentication

Adds needed functionality around authentication

A Few ASP.NET Identity Features

Login and logout

User registration

Password management

Two-factor authentication

Account lockout

User store

Course recommendation:

EF Core 6: The Big Picture

DbContexts in ASP.NET Core Identity

IdentityDbContext

AspNetUsers

AspNetUserClaims

...

ApplicationDbContext

Products

Sales

...

DbContexts in ASP.NET Core Identity

<https://4sh.nl/configureidentity>

Customizing Identity's UI

Require knowledge of Razor pages

Can be customized

But is it really needed?

`_ViewStart.cshtml` already sets the
themed layout page

Some pages need more customization
than others

Pages and Endpoints

If an endpoint for an Identity page exists in the project, that will be used

Identity uses the UI assembly as a fallback

Coming up: retrofitting Identity

Your Own User Class

Create it first before retrofitting Identity

Derive from IdentityUser

Possibility to add extra properties

Hard to add later

**Please look at the code for
the repositories and
controllers in the provided
solution if you're coding
along.**

SecurityStamp

Value stored in user table

Changes when credentials change or the account is locked

Stored as a claim in identity cookie

When new request occurs value for cookie is compared to database value

If no match: identity cookie rejected

Claims in UserClaims Table Or In User Type?

UserClaims

Easy

No need to add migration

**No need to use
IClaimsTransformation**

**Extra database query needed to
get them**

User type

**Claims directly accessible when
using Identity's APIs**

No additional queries needed

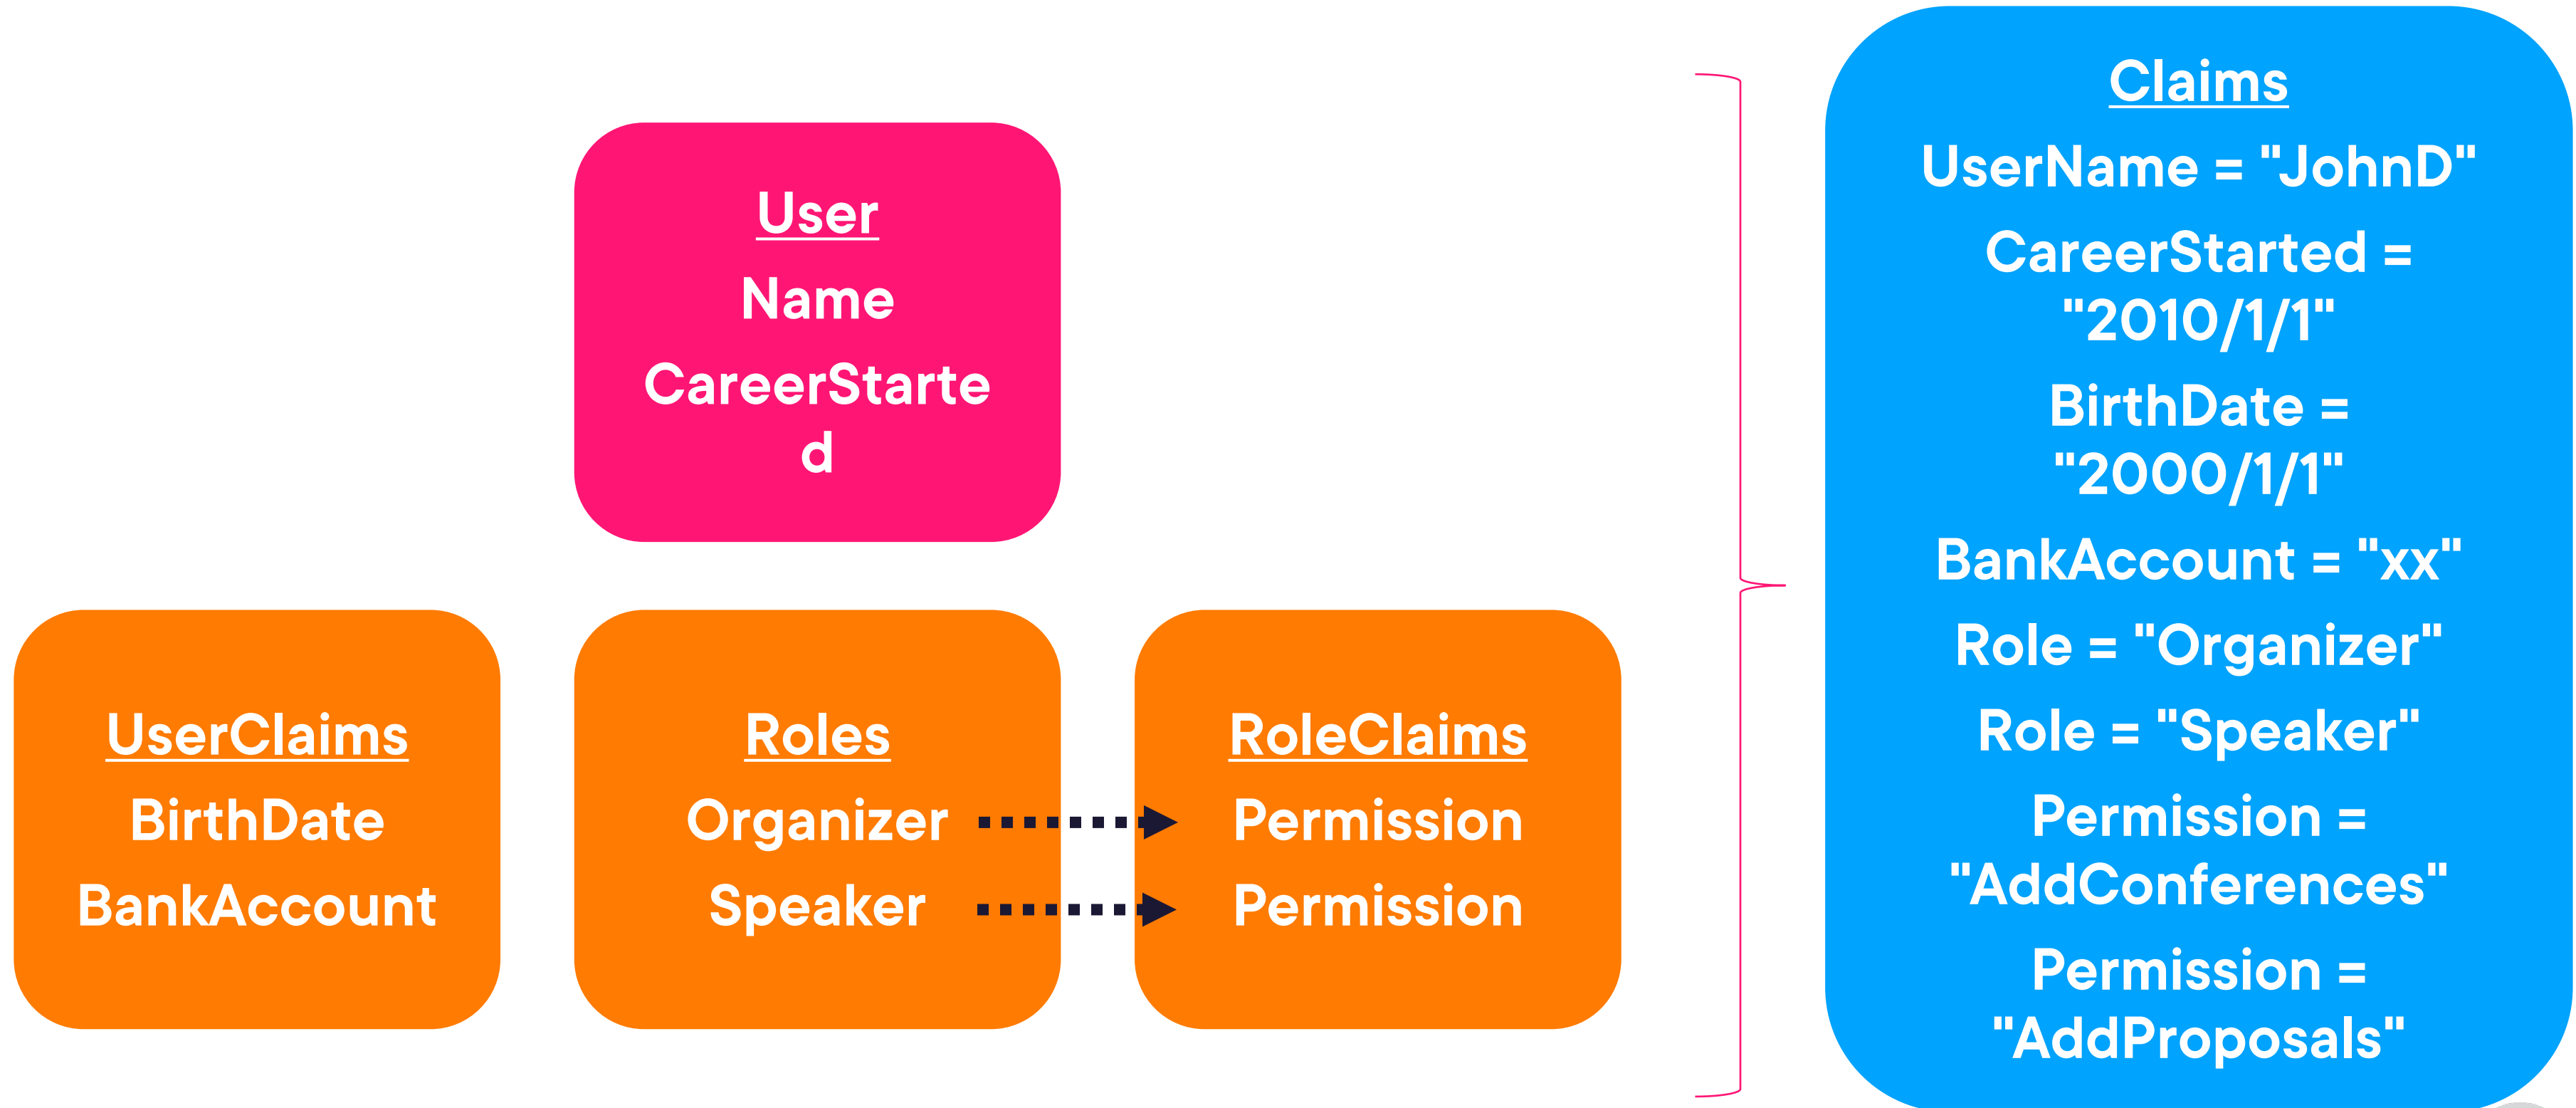

Role support is disabled by default

Role is a claim type

Claims and Roles

**Use RoleManager<TRole> to
manage roles**

Email functionality

```
graph TD; A[Email functionality] --> B[Register]; A --> C[Forgot password];
```

The diagram illustrates the structure of email functionality. A central pink box labeled 'Email functionality' has two blue arrows pointing downwards to two orange boxes: 'Register' on the left and 'Forgot password' on the right.

Register

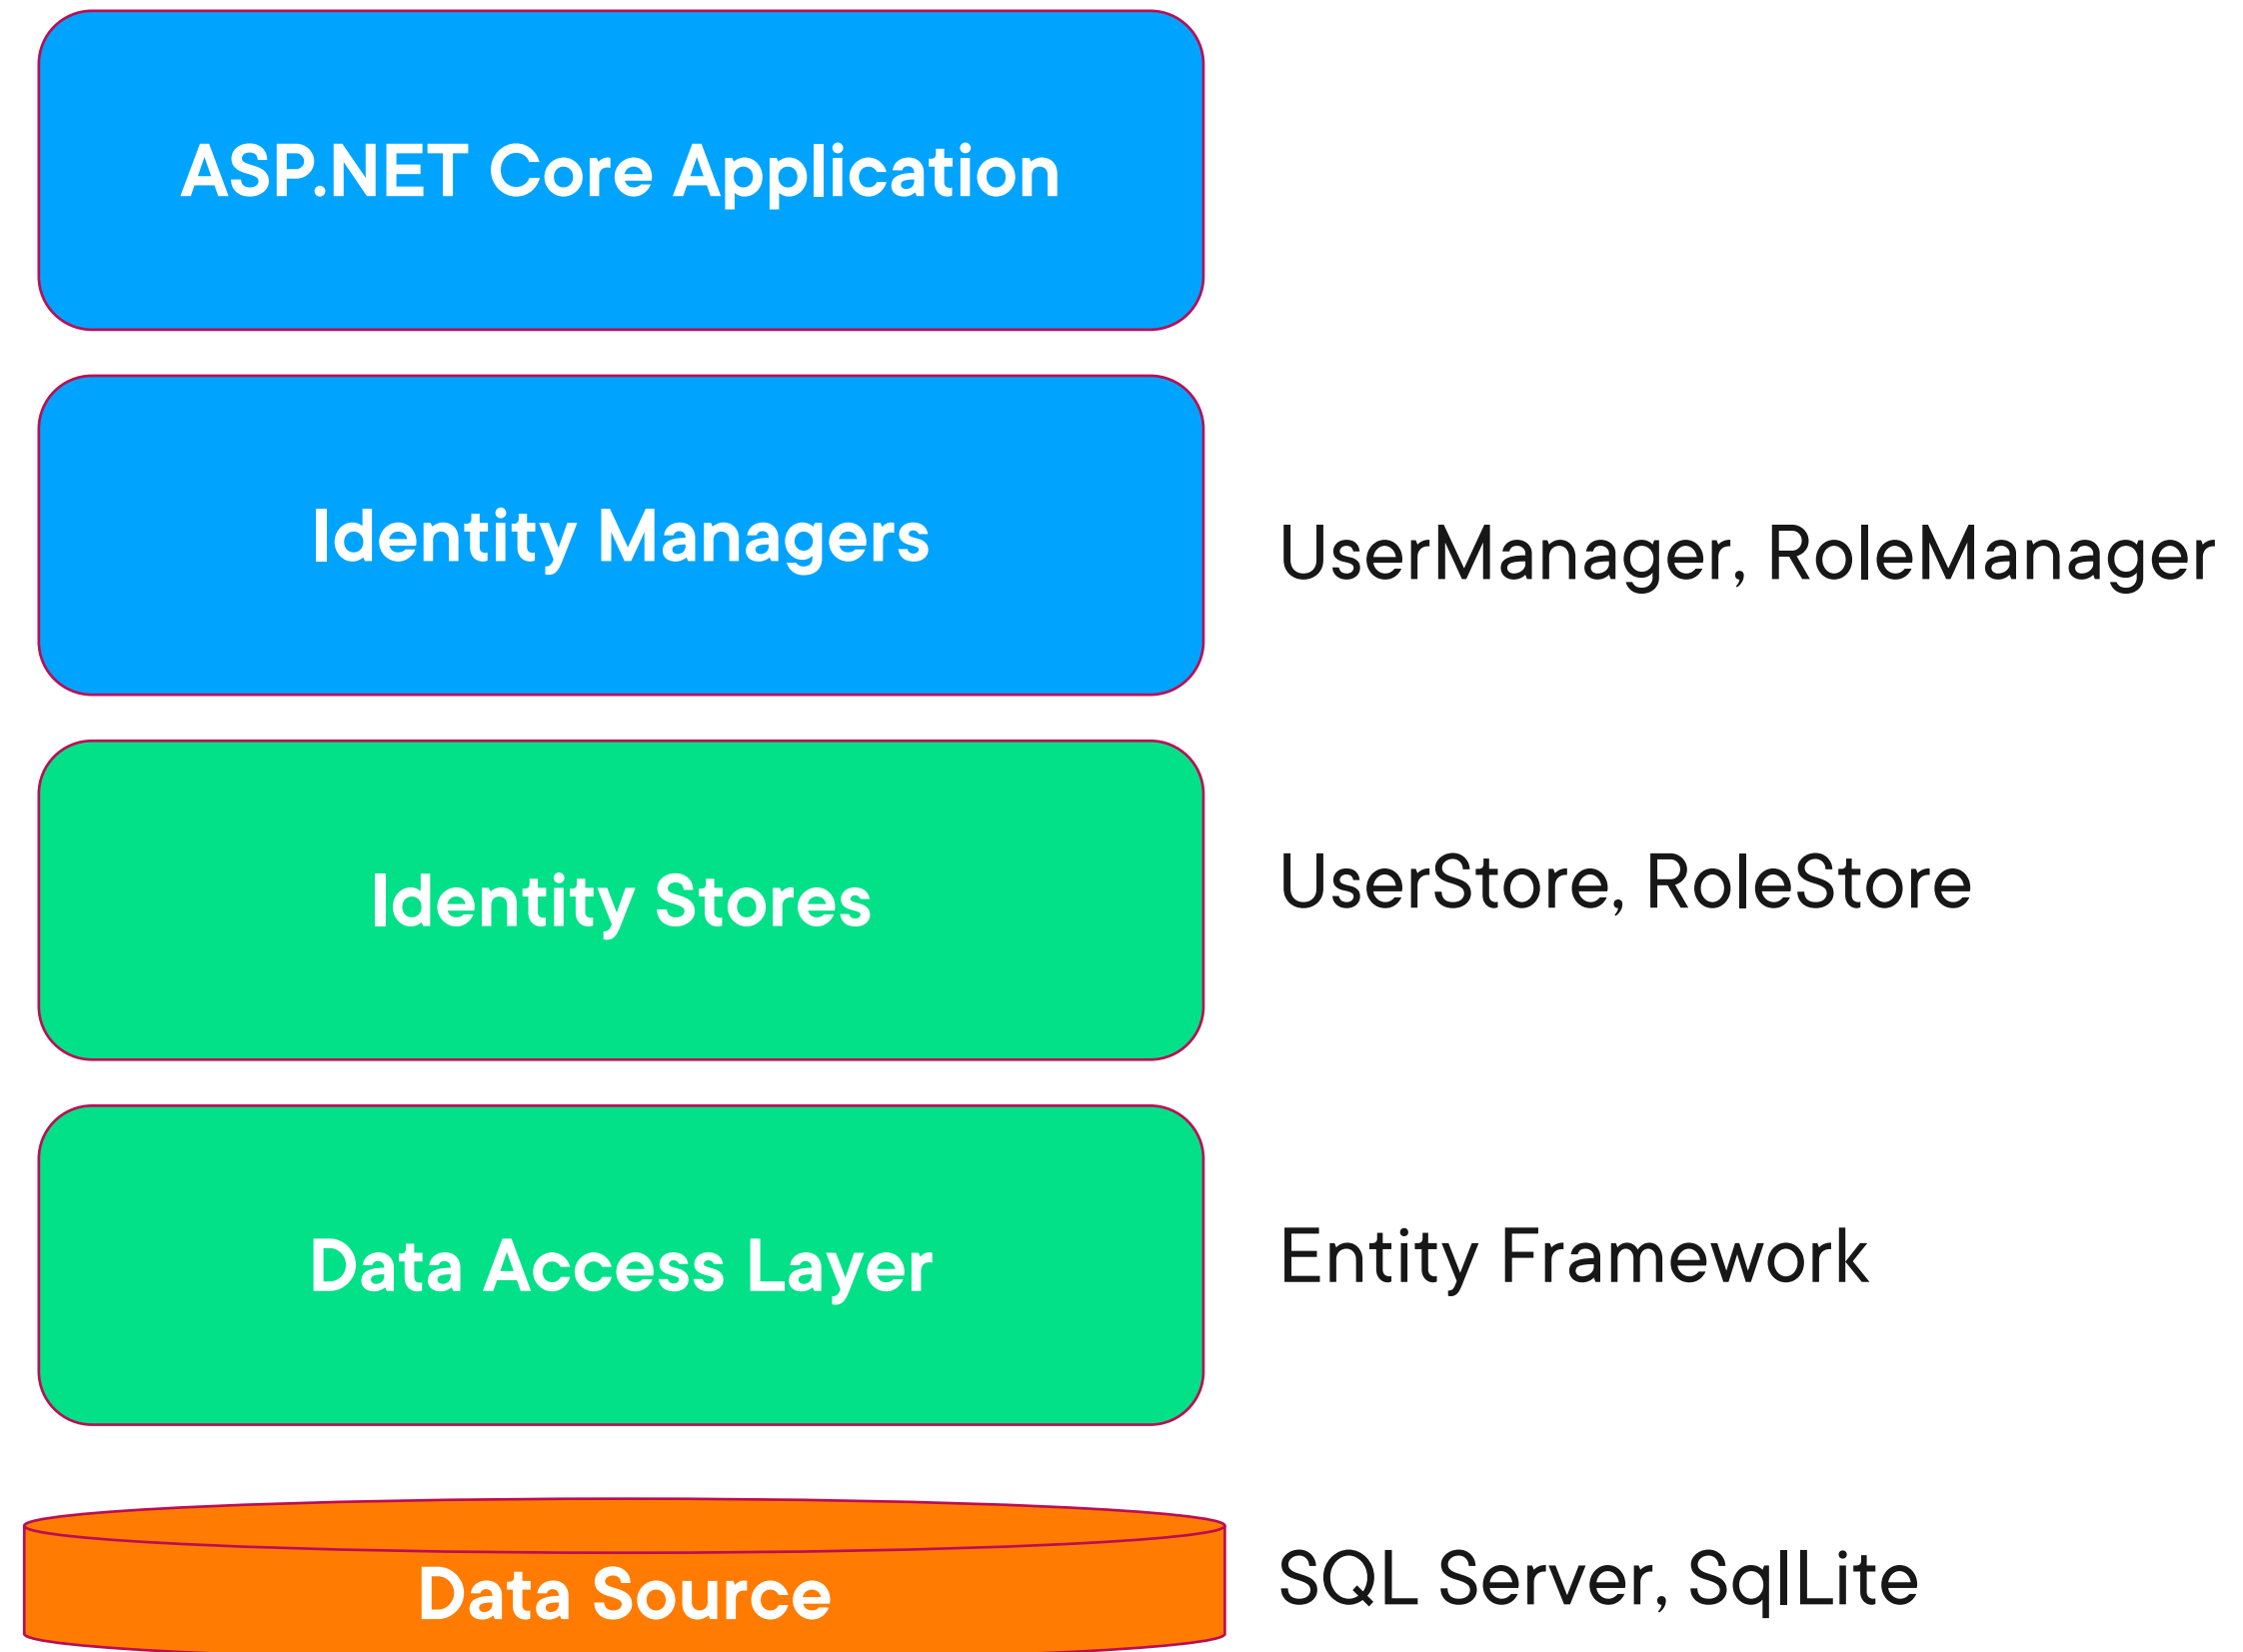

Forgot password

Customizing Identity Recipe

Find the class involved

Derive from the existing class you would like to customize

Override the relevant methods

Use a method on Identity's builder object to register it

Or just register in the dependency injection container

Extensibility: An Example

Implementation Steps

Create entity

Add id and navigation property in
ApplicationUser

Add to DbContext

Modify Identity's UserStore behavior
